Appendix 4: The difference between IEC 62471:2006 and EN 62471:2008

Table 4.1 wavelength step of the SUV(λ) is 1nm listed according to EN 62471 and 5nm listed according to IEC 62471. The system is calculated according to both IEC 62471 and EN 62471, so that the results which calculated have no influence to the issued result, especially for the lamp classification. As the result, EN 62471 can be covered for the tested items in this report.

About the starting wavelength from 180nm of EN 62471 and starting wavelength from 200nm of IEC 62471, it is very difficult to obtain the radiation below 200nm at common condition and also from the behaviour of samples which are tested. However, there should be no any output below 200nm for the normal lamps. As the result, EN 62471 can be covered for the tested items in this report.

About Blue-Light Small Source, the limit of Exempt Group is 0,01 W•m-2 according to EN 62471. It is referred to the Directive 2006/25/EC of the European parliament and of the council of 5 April 2006 on the minimum health and safety requirements regarding the exposure of workers to risks arising from physical agents (artificial optical radiation).
